Background

Breast cancer is one of the major causes of cancer death in women in the United States. The most effective way to treat breast cancer is to detect it at an early stage by screening patients periodically. Conventional film-screening mammography uses X-ray films which are effective in detecting early abnormalities of the breast. Direct digital mammography has the potential to improve the image quality and to take advantages of convenient storage, efficient transmission, and powerful computer-aided diagnosis, etc. One effective alternative to direct digital imaging is secondary digitization of X-ray films. This technique may not provide as high an image quality as the direct digital approach, but definitely have other advantages inherent to digital images. One of them is the usage of satellite-transmission technique for transferring digital mammograms between a remote image-acquisition site and a central image-reading site. This technique can benefit a large population of women who reside in remote areas where major screening and diagnosing facilities are not available.

The NASA-Lewis Research Center (LeRC), in collaboration with the Cleveland Clinic Foundation (CCF), has begun a pilot study to investigate the application of the Advanced Communications Technology Satellite (ACTS) network to telemammography. The bandwidth of the T1 transmission is limited (1.544 Mbps) while the size of a mammographic image is huge. It takes a long time to transmit a single mammogram. For example, a mammogram of 4k by 4k pixels with 16 bits per pixel needs more than 4 minutes to transmit. Four images for a typical screening exam would take more than 16 minutes. This is too long a time period for a convenient screening. Consequently, compression is necessary for making satellite-transmission of mammographic images practically possible.

The Wavelet Research Group of the Department of Electrical Engineering at The Ohio State University (OSU) participated in the LeRC-CCF collaboration by providing advanced compression technology using wavelet transform. OSU developed a time-efficient software package with various wavelets to compress a series of mammographic images. This document reports the result of the compression activities.

Wavelet Transform

Over the past decade, Discrete Cosine Transform (DCT) has been extensively used for the compression of still images. Based on DCT, JPEG ([1]) has been a widely accepted standard for image compression. Due to the use of block-based DCT in which the transform is performed on blocks of 8 by 8 pixels, JPEG tends to introduce annoying block artifacts at low bit rates which severely degrades the visual quality of the image. Wavelet transform is a new approach for image compression emerging in the past few years which has been proved superior to traditional DCT approaches. The wavelet transforms use two filter banks, low-pass (h) and high-pass (g), to localize the frequency distributions of an image globally. It out-performs the DCT transform because of the following advantages:

- Wavelet transform is applied to the entire image thus avoiding the block artifacts.

- Wavelet transform localizes signal characteristics in both time and frequency domains. Thus, more efficient exploration of spatial redundancies can be achieved.
- Wavelet transform supports continuous rate scalability. This allows the user to select a data rate according to the available bandwidth of the satellite communication link.

Figure 1 shows the block diagram of a typical wavelet transform ([2]).

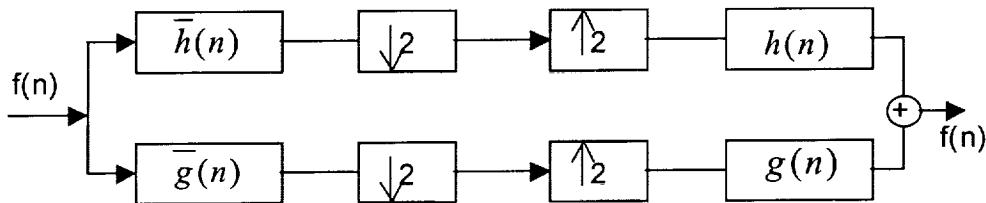

Figure 1 Wavelet analysis and synthesis of signal $f(n)$ where $\downarrow 2$ means down sampling and $\uparrow 2$ means up-sampling.

One disadvantage associated with the conventional wavelet transform is the lengthy computation time. OSU developed a time-efficient software package which is based on a so-called packed-integer computation ([3]) which overcomes this disadvantage. The wavelets used in the computation are completely integer-based which is much faster than floating-point arithmetic.

Activities

The Cleveland Clinic Foundation (CCF) provided OSU 50 digital mammograms. Each digital mammogram has a $50 \mu\text{m}$ spatial resolution and 1.6 k by 4 k pixels with 16 bits per pixel. As a result, each image has 12.8 M bytes which will be too time-consuming to transmit by the T1 transmission line. These 50 mammograms represent different patient cases such as malignant microcalcification, benign microcalcification, malignant tumor, benign tumor, architectural distortion, and normal.

We used the SP and TS wavelets to perform the wavelet transform. Both TS and SP wavelets can be implemented using the integer computation ([4]). The low-pass and high-pass filters, h and g , of the TS transform can be expressed as

$$h = \left[\frac{1}{2}, \frac{1}{2} \right] \quad (1)$$

and

$$g = \left[-\frac{1}{8}, -\frac{1}{8}, 1, -1, \frac{1}{8}, -\frac{1}{8} \right]$$

(2)

respectively. Those of the SP transform can be expressed as

$$h = \left[\frac{1}{2}, \frac{1}{2} \right] \quad (3)$$

and

$$g = \left[-\frac{1}{16}, -\frac{1}{16}, \frac{15}{32}, -\frac{17}{32}, \frac{7}{32}, -\frac{1}{32} \right]. \quad (4)$$

We first used the SP wavelets to compress the images using the compression ratios of 20:1, 60:1, 120:1, and 200:1, respectively. Then the TS wavelets were used to compress the images with compression ratios of 10:1, 20:1, and 60:1, respectively. Higher than 60:1 compression ratios such as 120:1 and 200:1 were dropped in the TS transform because they created too much distortion for reliable diagnosis in the SP transform. For each compression ratio, signal-to-noise ratio (SNR) was measured to compare the performance of the two wavelets. The compressed files were then used to reconstruct the mammograms which were reviewed by three radiologists at CCF for the preference study.

SNR is a numerical measure of the performance and is expressed as

$$SNR = 20 \log_{10} \frac{255}{RMSE} \quad (5)$$

where

$$RMSE = \sqrt{\sum_{i=1}^N \sum_{j=1}^M [f_{i,j} - f^*_{i,j}]^2} \quad (6)$$

where $f_{i,j}$ represents the original direct digital mammogram and $f^*_{i,j}$ represented the reconstructed images from the compressed files; N is the number of pixels in the x direction, and M in the y direction. A higher SNR represents a better quality of the reconstructed image.

In the preference study, three radiologists who specialize in mammography reviewed both compressed and uncompressed digital images. The 3 wavelet-compressed images (10:1, 20:1, and 60:1) were displayed simultaneously with the original mammograms. The readers ranked the images in order of preference where 1 is equal to the most desirable and

4 the least. A non-parametric rank-sum test was used to determine whether images compressed at different compression ratios differ significantly from the uncompressed original.

Results

As just mentioned, OSU compressed the 50 mammograms with both SP and TS wavelets. The result of the SP transform is shown in Appendix A and the result of the TS transform is shown in Appendix B. From the result, one can see that the computation time for each compression is short (on average it is less than 3 seconds). If floating-point instead of integer arithmetic was used, the computation time would be 10 times longer. Secondly, one can see that the SNR ranges from 33 to 40 for compression ratios between 200:1 to 20:1. When SNR is about 40, the visual quality of the reconstructed image is very good and shows no significant difference from the original image. The difference between the TS and SP wavelets is not significant although the SP wavelets are slightly better in some cases. Additional 28 files were compressed using the TS transform and the 10:1, 20:1 and 60:1 compression ratios, respectively for CCF. All the compressed files were transferred to NASA-LeRC and CCF electronically for archive.

The SNR value is not always consistent with the perceive quality by human eyes. Therefore, it is important that the compressed mammograms be tested by the radiologists. This was conducted at CCF by three certified readers. The report of the study is attached as Appendix C.

The readers reviewed 68 cases with both calcifications and masses. The report indicated that for calcifications, the differences between the original and C10 (10:1 compression ratio) are not statistically significant. The difference between the original and C20 is statistically significant for reader 2 and marginally significantly for reader 1. The difference between the original and C60 is statistically significant for both readers.

For masses, the differences between the original and C10 (10:1 compression ratio) are statistically significant for reader 2. The difference between the original and C20 is statistically significant for both readers. The difference between the original and C60 is statistically significant for both readers.

Further details of the preference study can be found in Appendix C.

Conclusions

From this initial study of wavelet transform for satellite-transmitted digital mammograms, we can draw a few conclusions:

- Wavelet transform is effective in compressing digital mammograms.
- Integer-based wavelets are computationally efficient and proved practical for compressing digital mammograms.

- Low compression ratio results in insignificant difference between the original and compressed images in the preference study. It appears that a lower than 10:1 compression ratio is necessary to eliminate the statistical significance by some of the readers.

We recommend to continuing the study by investigating more compression ratios until an optimal ratio is achieved. Another direction of future research is to use wavelet transform to enhance digital mammograms such that compressed images can reveal more diagnosis information even with a high compression ratio.

Medical Image Compression Document

Software: Medview—Medical Image Compression System.
Copyright 1998-1999, OSU Wavelet Research Group.

Images : Mammography pictures from Cleverland Clinic Foundation.
50 .raw files 1600*4000*2=12800000 bytes (12.2MB) each. B&W

General Settings of the Medview:

Transform Type: SP transform
Encoder : Stack Run
Quantizer : S-DZ(best quality)
Multiresolution : 5

Compression Requirement:

Compress each image with 4 different compression ratio of 20:1, 60:1, 120:1 and 200:1 and produce the Reconstruction file for each ratio.

Appendix B Results of the TS Wavelet Transform of 50 Mammograms

Medical Image Compression Document

Software: Medview—Medical Image Compression System., Revised version.
OSU Wavelet Research Group.

Images : Mammography pictures from Cleverland Clinic Foundation.
50 .raw files $1600*4000*2=12800000$ bytes (12.2MB) each. B&W

General Settings of the Medview:

Transform Type: TS transform
Encoder : Stack Run
Quantizer : S-DZ(best quality)
Multiresolution : 3

Compression Requirement:

Compress each image with 3 different compression ratio of 10:1, 20:1, and 60:1 for the purpose of comparison with the original approach.

Appendix C Results of the Preference Study by the Cleveland Clinic Foundation

TO: Kim Powell, PhD
FROM: Nancy Obuchowski, PhD
DATE: May 8, 2000
RE: Compression Study Analyses

For this analysis, two readers had data on 68 patients and one reader had data just on the original 40 patients. Thus, in this memo I describe the results for just the two readers with new data.

Statistical Methods

We used signed rank tests to compare the scores assigned to the original image to the scores assigned to C10, C20, and C60. A significance level of 0.05 was used for each comparison. A separate analysis was performed for each of the 2 readers.

Results

Tables 1 and 2 summarize the average rank of each of the 4 compression images for calcifications and masses, respectively. In parentheses we indicate the number of cases in which each image was assigned the highest preference (i.e. a score of 1). Note that there are several cases in which a reader assigned a score of 1 to more than one image.

For calcifications, the original image had the lowest average overall ranking for benigns, followed by C10; for malignants, the overall mean rank was the same for the original and C10. C20, then C60 followed. C10 was preferred in 32% of readings, C20 in 25%, and C60 in 22%, compared to the original which was preferred in 47% of readings.

For masses (table 2), the original image had the lowest average rankings overall, followed by C10, followed by C20, followed by C60. C10 was preferred in 29% of readings, C20 in 15%, and C60 in 29%, compared to the original which was preferred in 57% of readings.

Table 1: Descriptive Results for Calcifications

	ORIG	C10	C20	C60
<u>Reader 1</u>				
Malign. (N=17)	2.1 (7/17)	2.1 (7)	2.2 (6)	2.6 (4)
Benign (N=17)	1.6 (11/17)	2.1 (7)	2.5 (6)	2.4 (5)
<u>Reader 2</u>				
Malign. (N=17)	2.3 (5)	2.3 (4)	2.5 (3)	2.9 (4)
Benign (N=17)	1.7 (9)	2.4 (4)	2.9 (2)	3.1 (2)
<u>All</u>				
Malign. (N=34)	2.2 (12/34)	2.2 (11)	2.4 (9)	2.8 (8)
Benign (N=34)	1.6 (20/34)	2.2 (11)	2.7 (8)	2.7 (7)

Mean ranks and number of cases in which the image was assigned the highest preference (given in parentheses).

Table 2: Descriptive Results for Masses

	ORIG	C10	C20	C60
<u>Reader 1</u>				
Malign. (N=17)	1.5 (12/17)	2.1 (5)	2.2 (5)	2.4 (9)
Benign (N=17)	1.6 (8/17)	1.9 (9)	2.5 (3)	2.6 (4)
<u>Reader 2</u>				
Malign. (N=17)	1.6 (11)	2.6 (1)	2.8 (0)	2.8 (5)
Benign (N=17)	1.9 (8)	2.2 (5)	2.8 (2)	3.1 (2)
<u>All</u>				
Malign. (N=34)	1.6 (23/34)	2.4 (6)	2.5 (5)	2.6 (14)
Benign (N=34)	1.8 (16/34)	2.1 (14)	2.6 (5)	2.9 (6)

Mean ranks and number of cases in which the image was assigned the highest preference (given in parentheses).

For calcifications, the differences between the original and C10 are not statistically significant (see Table 3). The difference between the original and C20 is statistically significant for reader 2 and marginally significant for reader 1. The difference between the original and C60 is statistically significant for both readers.

For masses, the differences between the original and C10 is statistically significant for reader 2 (see Table 4). The difference between the original and C20 is statistically significant for both readers. The difference between the original and C60 is statistically significant for both readers.

Combining the data from calcifications and masses (see Table 5), the difference between the original and C10 is statistically significant for reader 2 and marginally statistically significant for reader 1. The difference between the original and C20 is statistically significant for both readers. Similarly, the difference between the original and C60 is statistically significant for both readers.

Table 3: P-values for Calcifications

	Reader 1	Reader 2
ORIG v. C10	0.302	0.258
ORIG v. C20	0.091	0.014
ORIG v. C60	0.040	0.006

Table 4: P-values for Masses

	Reader 1	Reader 2
ORIG v. C10	0.136	0.010
ORIG v. C20	0.002	<0.001
ORIG v. C60	0.004	0.002

Table 5: P-values for Calcifications and Masses Combined

	Reader 1	Reader 2
ORIG v. C10	0.083	0.011
ORIG v. C20	0.001	<0.001
ORIG v. C60	0.001	<0.001

Conclusions

The results indicate that we cannot confidently replace the original image with any of these compressed images.
